

AWS IAM Multi-Factor Authentication (MFA) Configuration Report

Abstract

This report explains the implementation of AWS Identity and Access Management (IAM) security credentials with Multi-Factor Authentication (MFA). MFA enhances AWS account security by requiring a second authentication factor in addition to the password.

Introduction

AWS IAM enables secure management of users, groups, roles, and permissions. MFA is a security best practice that protects privileged accounts from unauthorized access even if passwords are compromised.

Project Objectives

- Configure AWS IAM Security Credentials.
- Enable Virtual MFA.
- Improve AWS account protection.
- Understand IAM security features.
- Document the configuration process.

Prerequisites

AWS Account, IAM Console access, Authenticator application, Internet connection, and a supported web browser.

Implementation Steps

1. Sign in to AWS Console.
2. Open IAM Dashboard.
3. Navigate to Security Credentials.
4. Select Assign MFA Device.
5. Configure Virtual MFA using an authenticator app.
6. Scan the QR code and verify two consecutive codes.
7. Save the configuration and verify successful activation.

1. INTRODUCTION

2. IAM USER DETAILS

User Name	dharanika
AWS Account ID	56329679417
Canonical User ID	7ca4a9a42184efd2b4d6ef5077a504165150fee24157972e72489a9d97cdd66
Email Address	dharanika0149@gmail.com

3. SCREENSHOT – MY SECURITY CREDENTIALS

[illegible]

4. MFA (MULTI-FACTOR AUTHENTICATION) DETAILS

MFA Type	Identifier	Certifications	Created On
Virtual	arn:aws:iam::563290679417:mfa/dharanika	Not Applicable	Fri Jul 17 2026

5. KEY HIGHLIGHTS

- The IAM user **dharanika** is successfully configured with a Virtual MFA device.
- MFA enhances account security by requiring a verification code in addition to the password.
- Up to 8 MFA devices can be assigned to a single IAM user.
- MFA is strongly recommended for all privileged users.

The screenshot displays the AWS IAM Security Credentials page after successful MFA configuration. The account details, AWS Account ID, email address, and Virtual MFA device are visible. The green notification confirms that the MFA device has been assigned successfully, indicating that the AWS account is now protected with an additional authentication layer.

- Prevents unauthorized access.
- Protects privileged AWS accounts.
- Meets security best practices.
- Reduces account compromise risk.
- Improves compliance with security standards.

MFA is widely used by cloud administrators, DevOps engineers, security engineers, enterprises, financial institutions, healthcare organizations, and government agencies to secure sensitive cloud resources.

AWS IAM with Multi-Factor Authentication provides strong account protection by adding an extra verification step during login. Implementing MFA significantly improves the security posture of AWS environments and is considered a mandatory best practice for production cloud accounts.
