

CarePlus Hospital Website Deployment using Docker Compose

This document explains a hospital website project deployed using Docker Compose on AWS EC2. The project demonstrates containerized deployment of a responsive healthcare website with sections such as Home, Services, Doctors, Appointment, and Contact. Docker Compose manages multiple services, ensuring easy deployment, scalability, and consistency.

Project Overview

The website is built using HTML, CSS, JavaScript and served through an Nginx container. Docker Compose orchestrates the web service, maps port 5000, mounts project files, and simplifies deployment with a single command.

Folder Structure

```
project/
├── docker-compose.yml
├── Dockerfile
├── index.html
├── css/
├── js/
└── images/
```

Docker Compose

```
version: '3.8'
services:
  web:
    build: .
    ports:
      - "5000:80"
```

Deployment Steps

1. Install Docker and Docker Compose.
2. Clone the repository.
3. Run `docker compose up --build -d`.
4. Open `http://EC2-Public-IP:5000`.

Features

- Responsive UI
- Emergency Helpline Banner
- Doctors Section

- Appointment Button
- Dockerized Deployment
- Easy Scaling and Maintenance

Conclusion

Docker Compose provides a simple and reliable way to deploy the CarePlus Hospital website with minimal configuration. The project demonstrates containerization, reproducibility, and cloud deployment best practices.
