

CarePlus Hospital - Docker Deployment on AWS EC2

This project demonstrates deployment of a responsive hospital website using Docker on an AWS EC2 instance. The application includes a modern homepage, services section, doctor profiles, appointment interface, and responsive navigation. The Docker image was built locally on the EC2 instance and executed by exposing port 5000. The project also demonstrates Docker image creation, container execution, networking, and volume concepts.

Technologies Used: HTML, CSS, JavaScript, Docker, Dockerfile, AWS EC2, Ubuntu Linux, Git/GitHub.

Key Docker Commands

docker build -t hospital-app .

docker images

docker run -d -p 5000:5000 hospital-app

docker ps

docker volume create hospital-volume

docker network create hospital-network

Features: Responsive UI, Emergency Helpline, Services, Doctors, Appointment Section, Containerized Deployment, Cloud Hosting, Easy Portability, Fast Deployment, Consistent Runtime Environment.

Conclusion: This project demonstrates how containerization simplifies application deployment. Docker packages the application and its dependencies into a portable image, while AWS EC2 provides scalable cloud infrastructure for hosting. The result is a reliable, maintainable, and production-ready deployment workflow suitable for DevOps learning and portfolio projects.
